the Mississippi River. This transfer of a cyclonic center across a mountain range produces the southerly curvature in the average storm track of cyclones crossing the North American Continent. The extreme southern limit reached by any track depends upon the dryness and the pressure of the air in the rear, and the turning point is usually found in the neighborhood of Lake Superior, or else in Missouri, or, even. in Texas.

XII.—This began on the 13th in eastern Kentucky and moved rapidly northeastward, reaching Halifax on the 14th, p.m., having been followed by severe northwest winds on the had begun to fall at the region where these contrasted winds Atlantic coast. This was another illustration of the rapid development of small areas on the east side of the Appalachians east of Boston, the minimum pressure at the center having while a high area and cold weather prevails on the west side.

XV.—This began on the 18th, a. m., when a slight depression existed in Kansas, with a high area far to the northward. The low moved southward and then east, passing Arkansas on the 19th, p. m., Tennessee on the 20th, a. m., and was found off the North Carolina coast on the 21st, a.m. Numerous heavy local rains attended this storm, and high northwest winds, followed by frosts, prevailed in the rear.

XVI.—This storm moved from the Pacific Ocean eastward into British Columbia on the 18th, 19th, and 20th. Gales, with heavy rains, prevailed in the western part of Oregon and Washington. By the 22d, a. m., the low center was in Alberta, although rain and snow continued in Washington and Oregon. During the 23d the center passed over Manitoba and on the 24th, p. m., was central on the northern of the month, and by the 31st, p. m., the center was in Misborder of Lake Superior, while southwest gales prevailed over souri.

the greater part of the Lake region, followed by northwest gales and snow on the 25th. This was the southernmost point in its path, and it turned northeastward on the morning of the 25th, disappearing on the 26th in Labrador.

XVII.—This area moved from Alberta to the Lower Lake region without any specially marked feature, but on the 27th, p. m., the northwest gales over Lake Huron on its western side had a temperature near the freezing point, while the southwest winds over the middle Atlantic States and Lower Lakes had temperatures of 50° or 60°, and light rain or snow were mixing. On the 28th, a. m., the storm center was a little fallen about 0.30 inch, heavy northwest gales were prevailing over the middle Atlantic States and heavy snow from Vermont to the coast of Maine. The center now turned northward, passing along the coast of Nova Scotia and over Newfoundland as a severe hurricane. The lowest pressure recorded was 28.78 at Sydney, C. B. I.

XVIII.—This storm, like the preceding, No. XVI, also moved northeastward toward Vancouver Island, and by the 27th, p. m., was central in British Columbia. By the 28th, p. m., the trough of low pressure extended from Alberta to Nebraska, being now on the east side of the Rocky Mountains, and the 29th, a. m., this had, as usual, closed up into a central depression representing the southern end in South Dakota. The southward movement continued until the end

NORTH ATLANTIC METEOROLOGY.

Ice.—The following table shows the southern and eastern limits of the region within which icebergs or field ice were reported for March during the last 13 years:

Southern limit.			Eastern limit.		
Month.	Lat. N.	Long. W.	Month.	Lat. N.	Long. W.
	0 1	01		0 1	0,
March, 1882	42 20	50 00	March, 1882	46 30	46 00
March, 1888	41 46	49 48	March, 1883	48 40	43 09
March, 1884	41 20	54 06	March, 1884	45 00	40 18
March, 1885	40 55	49 04	March, 1885	45 57	43 13
March, 1886	40 20	49 02	March, 1886	47 20	44 40
March, 1887	41 00	49 07	March, 1887	45 81	43 56
Матец, 1888	42 30	50 87	March, 1888	47 23	46 56
March, 1889	44 20	53 00	March, 1889	44 20	53 00
March, 1890	41 01	50 54	March, 1890	46 40	39.50
March, 1891	42 25	50 80	March, 1891	49 00	48 44

March, 1894	40 20	49 36	March, 1894	46 25	42 80
March, 1895	44 43	57 15	March, 1895	44 51	48 38
Mean	42 04	50 10	Mean	46 15	45 00

The limits of the region within which icebergs or field ice sixty-fifth meridian 3 less than the average.

were reported for March, 1895, are shown on Chart I by crosses. The southernmost ice reported, a large field of ice noted on the 25th, was about 2½° north of the average southern limit, and the easternmost ice observed, a berg of moderate size noted on the 31st in the position given in the table, was about 41° west of the average eastern limit of ice for March.

Ice was reported on four dates during the current month. A great deal of slush ice, closely packed about half the time, was encountered near the coasts of Newfoundland; but the ice was thin as compared with former years. Much heavy ice was encountered in the Gulf of St. Lawrence.

Fog.—The limits of fog belts west of the fortieth meridian, as reported by shipmasters, are shown on Chart I by dotted shading. East of the fifty-fifth meridian fog was reported on 9 dates; between the fifty-fifth and sixty-fifth meridians on 5 dates, and west of the sixty-fifth meridian on 8 dates. Compared with the corresponding month of the last seven years the dates of occurrence of fog east of the fifty-fifth meridian numbered 4 more than the average; between the fifty-fifth and sixty-fifth meridians 3 less than the average; and west of the

TEMPERATURE OF THE AIR.

[In degrees Fahrenheit.]

The mean temperature is given for each station in Table II, for voluntary observers, but in Table I, for the regular stations of the Weather Bureau, both the mean temperatures and the departures from the normal are given for the current allowed, as shown by the notes appended to Table II. month.

The monthly mean temperature published in Table I, for the regular stations of the Weather Bureau, is the simple mean of all the daily maxima and minima; for voluntary stations a variety of methods of computation is necessarily

The distribution of the monthly mean temperature of the
